This growth inhibition is antagonised by growth from the plant in the products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin blosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin blosynthesis, such as paclobutrazol, dwarf but let crop plants grow tall. The present sequence is

its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by globerallin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin blosynthesis, such as paclobutazol, e.g. to allow use of a gibberellin blosynthesis inhibitor to keep weeds obtained after partially commenced.

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin.insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis, such as paclobutrazol, dwarf but let crop plants grow tall. The present sequence represents the wheat Rht clone 5al genomic sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New Triticum Aestivum polynucleotides · encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 2125 BP; 325 A; 768 C; 723 G; 309 T; 0 other;

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Assituum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents the composite DNA sequence of wheat Rht gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype

```
The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Assituum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by the conferring a dwarf phenotype on a plant which is correctable used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin blosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by growth of the plant. This growth inhibition is antagonised by growth of the plant. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with any be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin blosynthesis, such as paclobutrazol, compounds which inhibit gibberellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents the partial sequence of the maize D8-2023 allele.

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth inhibition is antagonised by globerellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with globerellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being globerellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit globerellin blosynthesis, such as paclobutrazol, e.g. to allow use of a globerellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype

its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis, such as paclobutrazol, dwarf but let crop plants grow tall. The present sequence represents the maize lal genomic clone sequence.

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by globerellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Tailer plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin blosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the partial cDNA sequence of rice AAD39460 (a wheat Rht gene homologue)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Partial cDNA sequence of rice D39460 (a wheat Rht gene homologue).

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Asstivum, inhibit growth of the plant. This growth inhibition is antagonised by glubberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gluberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gluberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologus gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gluberellin blosynthesis, such as paclobutrazol, eg. to allow use of a gluberellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence was obtained after partially sequencing wheat Rht clone 5al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is given in a specification relating to the structure and function of a regulatory gene, SCARECROW (SCR).

SCARECROW-like (SCL) genes encoding proteins containing an amino acid sequence similar to the sequence of MOTIF III (VHIID) of Arabidopsis SCR protein are disclosed. SCR and SCL genes are useful for producing transgenic plants whose cell division is modified and root and/or stem development and gravitropism of stem or hypocotyl is altered. Cell division is increased or decreased in roots resulting in thicker or thinner root development. The transgenic plants are useful for expressing a gene of interest encoding a gene product that confers herbicide, salt, pathogen or insect resistence in root or embryos and genes encoding starch, lighth or cellulose biosynthesis in shoots. The SCR gene also confers less susceptibility to lodging in the transgenic plants than a wild-type plant. SCR gene sequences are also useful as molecular markers in the sequences are also useful as molecular markers.

creators which may be used to modify phenotype associated with a plant's sugar sensing characteristics and increasing yield when their expression level is altered. Sugars are central regulatory molecules that control superts of physiology, metabolism and development. Therefore the cDNAs and proteins of the invention are useful for modifying the growth and germination rates of plants, photosynthesis, glyoxylate metabolism, response, wounding response, cell cycle regulation, pathogen response, wounding response, cell cycle regulation, pathogen response, wounding response, cell cycle regulation, pagmentation, flowering and senescence of plants and for modifying sink source relationships in seeds, tubers, roots, and other storage organs leading to an increase in yield. The transcription factor polynucleotides and polypeptides may be used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed, sunflower, alfalfa, sugarcane, turf, banana, blackberry, blueberry, strawberry, raspberry, cantaloupe, carrot, cauliflower, coffee, cucumber, eggplant, grapes, honey dew, lettuce, mango, melon, onion, papaya, peas, peepers, pineapple, spineaple, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Transcription factor; biochemical characteristic; controlling element; structural characteristic; developmental characteristic; gene therapy; agricultural biotechnology; plant trait modification; ss.

```
The present sequence is Arabidopsis thaliana transcription factor, G307 cDNA. The transcription factor is used for altering a plant's biochemical characteristics. The transcription factor may be used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugar cane, turf, banana, blackberry, blueberry, strawberry, raspberry, cantaloupe, carrot, cauliflower, coffee, cucumber, egyplant, grapes, honey dew, lettuce, mango, melon, onion, papaya, peas, peppers, plneaple, splnach, squash, sweet corn, tobacco, tomato, watermelon, cosaceous fuuts and/or vegetable brassicas. Transcription factors are key controlling elements of biological pathways and altering expression levels of 1 or more transcription factors can change entire biological pathways in an organism. Therefore manipulating transcription factor fevels in plants offers great potential in agricultural biotechnology for modifying a plant's traits. Transcription factor cDNA is useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding plant transcription factor polypeptides, useful for altering the biochemical characteristics of plants e.g. corn,

The patent relates to polynucleotides encoding 35 plant transcription factors which may be used to modify phenotype associated with a plant's sugar sensing characteristics and increasing yield when their expression level is altered. Sugars are central regulatory molecules that control aspects of physiology, metabolism and development. Therefore the CDNAs and proteins of the invention are useful for modifying the growth and germination rates of plants, photosynthesis, glyoxylate metabolism, respiration, starch and sucrose synthesis and degradation, pathogen response, wounding response, cell cycle regulation, plydmentation, plowering and senescence of plants and for modifying sink-source relationships in seeds, tubers, roots, and other storage organs leading to an increase in yield. The transcription factor polynucleotides and polypeptides may be used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed, sunflower, alfalfa, sugarcane, turf, banana, blackberry, collee, cucumber, eggplant, grapes, honey dew, lettuce, mango, meton, coffee, cucumber, eggplant, grapes, honey dew, lettuce, mango, meton, onlon, papaya, peas, peppers, pleapple, spinach, squash, sweet con,
Plant transcription factor; phenotype; sugar sensing characteristic; transgenic plant, plant yield; growth; germination; photosynthesis; glyoxylate metabolism; respiration; pathogen response; wounding response; cell cycle regulation; pigmentation; flowering; senescence; physiology;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       acco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas present sequence is an Arabidopsis thallana transcription factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding plant transcription factor polypeptides, useful for altering the sugar sensing characteristics of plants and increasing yield, e.g. corn, potato and cotton plants -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Riechmann JL;

such as soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugar cane, turf, banana, blackberry, blueberry, strawberry, raspberry, cantaloupe, carrot, cauliflower, coffee, cucumber, eggplant, grapes, honey dew, lettuce, mango, melon, onlon, papaya, peas, peppers, pineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas. Transcription factors are key controlling elements of biological pathways and altering expression levels of 1 or more transcription factors can change entire biological pathways in an organism. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biology for modifying a plant's traits. Transcription factor cDNA is need.
  alter the structure and developmental characteristics of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid encoding gibberellin inhibitor GAI and related antisense sequences – used to create tall, or particularly, dwarf plants, especially crops such as maize, rice and wheat

GRAS protein; BZH gene; transcription factor; gibberellin; morphogenesis; plant development; dwarf plant; crucifer; ss.
                                                                                                                                          insensitivity (gai) gene product (GAI), the expression of which inhibits plant growth. However the inhibition is antagonised by combined that is insensitivity (gai) expression confers a dwarf phenotype that is insensitive CGA, while gai expression confers a dwarf phenotype produce tall or dwarf plants, particularly the latter for increased resistance to lodging and increased yield. It may also allow regulation of flowering, i.e. plants remain in the vegetative state until treated with GA, useful to inhibit boilting in spinach and letture. GAI can be used to raise specific antibodies for identifying homologous proteins or genes in other species. gai fragments can also be used as probes or primers to identify and sense expression regulating (co-suppressing) sequences. Rice plants that express GAI may be resistant to Bakane disease. Mainfulation of gai and GAI makes it possible to tailor the degree of dwarfism
                                                                                                             The present sequence encodes the Arabidopsis thaliana gibberellin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seq_name: /SIDS2/gcgdata/geneseq/geneseqn/NA2001.DAT:AAF25480

GRAS protein; BZH gene; transcription factor; gibberellin; morphogeneals; plant development; dwarf plant; crucifer; ss.
                                                                                                                                                                                             The present sequence encodes a wild type plant protein of the GRAS family. The specification describes a mutant allele of the BZH gene, which contains a f1655A mutation resulting in the mutation E546K in the protein. GRAS proteins are transcription factors implicated in regulation of the response to gibberellins and thus in control of morphogenesis and plant development. The mutant GRAS protein is used to produce dwarf plants, specifically cruoifers. Dwarf plants be sown earlier (increasing nitrate accumulation without risking excessive stem growth during winter), and have better resistance to cold and lodging. They are also easier to harvest and allow for better monitoring of the crop.
                                                                              Ç

The mutant allele of the BZH gene contains a G1695A mutation resulting in the mutation E546K in the protein. GRAS proteins are transcription factors implicated in regulation of the response to gibberellins and thus in control of morphogenesis and plant development. The mutant GRAS protein is used to produce dwarf plants, specifically crucifiers. Dwarf plants may be sown earlier (increasing nitrate accumulation without risking excessive stem growth during winter), and have better resistance to cold and lodging. They are also easier to harvest and allow for better monitoring of the crop.

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants can be be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as pacloburrazol, eg. to allow use of a gibberellin biosynthesis, such as pacloburrazol, dwarf but let crop plants grow tall. The present sequence was dwarf with eartially sequencing wheat Rht clone 14al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is
New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mologue; Triticum aestivum; wheat; growth inhibition;

plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as pacibutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence represents the partial sequence of the wheat rht-10 allele.
                                              The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit prowth of the plant. This growth inhibition is antagonised by globberellin. The products can be used to provide Rht expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis;
antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA sequence obtained after sequencing wheat Rht clone 14al.

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit: growth of the plant. This growth inhibition is antagonised by globerellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are products can be to produce Rht mutant plants which are resistive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin blosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin blosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence was contained after partially sequencing wheat Rht clone 14al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding Hevea brasiliensis (S)-hydroxy:nitrilase - useful for production of cyanohydrin(s) from aldehyde and hydrogen cyanide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (S)-hydroxynitrilase; production;(S)-cyanohydrin; aldehyde;hydrogen cyanide; recombinant;ss.

Recombinant S-HN has higher specific activity

and ketone.

```
vea brasiliensis S-hydroxy:nitrilase - and recombinant equivalent
high specific activity, for chiral synthesis of cyano:hydrin(s)
(S)-cyanohydrins from aldehyde and hydrogen cyanide. Recombinantly produced S-HN has higher specific activity than native S-HN, probably due to post translational modification differences between plants and microoranisms.

S-HN was isolated from H. brasiliensis leaves by homogenisation, followed by sequential chromatography on QAE-Sepharose FF, Phenyl-Sepharose and Biogel P180. A cDNA bank from the same source was prepared and screened with polyclonal rabbit antiserum raised against the isolated enzyme. The insert, about 1.1 kb, in the single positive clone was cloned into pHNLL00 and sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes the Hevea brasiliensis
S-hydroxynitrilase (S-HN), which can be used for the chiral
synthesis of aliphatic or aromatic S-cyanohydrins from HCN, or its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Schall M;

```
than the native enzyme.

H. brasiliensis leaves were homogenised in cold pH 6.5 K phosphate buffer, and the extract subjected to sequential chromatography on OAB-Sepharose. Phenyl-Sepharose and BioGel 150 to recover a protein with a specific activity of 19 IU/mg.

A CDNA library was prepared from young H. brasiliensis leaves in Zap phage, and screened with polyclonal rabbit antiserum raised against the purified enzyme. The insert in one positive clone was isolated, and ligated into pBluescript to form pHNL-100. This plasmid, in E. coli SOLK, expressed a fusion protein with lacz that was immunoreactive. Sequencing showed that the insert in this plasmid was not complete, and the missing 5'-end generated by 2 stage PCR, resulting in plasmid pHNL-101, containing the entire
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /*tag= a

This nucleic acid sequence is a cDNA coding for human KSGal6ST (Keratan sulphate 6-sulphotransferase). The sequence was obtained by radiolabelling the cDNA of chick chondroitin 6-sulphotransferase (C6ST) and using this as a probe in a random oligonuclectide primed labelling method. Human foetal brain cDNA was inserted into a phage Lambda gtll clone; where the clones containing the KSGal6ST were obtained by hybridization using the prepared probe. The positive clones were subcloned into a recombinant expression vector and used to transform cost. The positive from which calls expressing KSGal6ST was nbe selected. The phage cDNA inserts were isolated and subcloned into a Bluescript plasmid. Deletion clones were then prepared from which both strands were sequenced betton clones method. The KSGal6ST of the invention transfers the sulphate from a sulphate donor to galactose 6-0H groups in keratan compliante, but does not transfer sulphate to chondroitin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Porcine reproductive and respiratory syndrome; PRRS; pig; vaccine;

The present sequence is that of open reading frame (ORF) 1b of porcine reproductive and reapiratory syndrome (PRRS) virus strain ATCC VR-2332. It encodes a 1457 annio acid viral protein (see AAB82665). The invention provides live attenuated PRRS viruses which are attenuated by at least 1 amino acid mutation in a specific site of the viral protein coded by ORF 1b or ORF 2. A claimed live attenuated PRRS virus has at 1 east 1 of the amino acids in positions 321-341 of the ORF1a-encoded protein (see AB82655), and/or at least 1 of the amino acids in positions 321-341 of the amino acids in positions 1-20 of the ORF 2-encoded protein (see AB82657) deleted. Of the ORF 1b-encoded protein, and/or at least 1 of the amino acids in positions 1-20 of the ORF 2-encoded protein (see AAB82667) deleted. Other claimed live attenuated PRRS viruses have amino acid 31 of ORF2 deleted or replaced by an amino acid ont identical to that of ARCC VR-2332. Specific mutations are created using molecular cloin are also claimed. The live attenuated PRRS viruses are used in the manufacture of a vaccine for the prophylaxis and treatment of PRRS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Porcine reproductive and respiratory syndrome virus; PRRSV; vaccine; plg; attenuated virus; \ensuremath{\mathrm{ds}} .

The present invention provides a novel method of producing attenuated versions of viruses, using multiple passage through cell cultures and involving the removal of samples of the virus prior to the induction of cytopathic effects. The sample is then inoculated into the next cell culture. The sequence of the naturally-occurring Lelystad virus (also known as the porcine reproductive and respiratory syndrome virus or PRRSV) atypical strain JA-142 is provided, along with that of a modified version of the virus. The modified version can be used in the vaccination of pigs against the Lelystad virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           reproductive and respiratory syndrome virus; PRRSV; vaccine; pig;

```

```
The present invention provides a novel method of producing attenuated versions of viruses, using multiple passage through cell cultures and involving the removal of samples of the virus prior to the induction of cytopathic effects. The sample is then inoculated into the next cell culture. The sequence of the naturally-occurring Lelystad virus (also known as the porcine reproductive and respiratory syndrome virus or PRRSV) atypical strain JA-142 is provided, along with that of a modified version of the virus. The modified version can be used in the vaccination
                                                                                                         Gorcyca DE;
                                                                                                                                                                                                                 Passaging viruses to attenuation comprises maintaining virus in logarithmic phase of replication throughout multiple cell culture passages, useful for protection against atypical porcine reproductive and respiratory syndrome virus -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   syndrome virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  North American porcine reproductive and respiratory syndrome virus

The present sequence is that of cDNA corresponding to the North American porcine reproductive and respiratory syndrome (PRRS) virus isolate P129A RNA genome. The cDNA in plasmid p77129A is deposited as ATCC 20348B. The P129 virus was originally isolated from a struck p129A was obtained after 10 serial passages from the pig. The DNA sequence includes B oper reading frames (ORFS 1a, 1b, 2-7) encoding polyproteins comprising protease, replicase and helicase functions, small membrane proteins a major envelope corporation, an integral membrane protein and a nucleocapsid protein. The invention provides isolated polynucleotide molecules, plasmids, viral vectors and transfected host cells that comprise plasmids, viral vectors and transfected host cells that comprise molecules, viral vectors and transfected host cells encoding genetically modified North American PRRS viruses that are disabled in their ability to cause PRRS. The invention also provides comprises comprising such plasmids, Narolecules, viral vectors and contens and morth American PRRS viruses that are disabled in their ability to cause PRRS. The invention also provides cand North American PRRS viruses that are disabled and North American PRRS viruses, viral vectors and enthods of using these a genetically modified North American PRRS viruses may also comprise a genetically modified North American PRRS viruses of using these a genetically modified North American PRRS viruses of using these a genetically modified North American PRRS viruses of using these a genetically modified North American PRRS viruses of using these a genetically modified North American PRRS viruses of using these a genetically modified North American PRRS viruses of using these a genetically modified North American PRRS viruses of using these and pertention of the viruses of the province of the virus of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide encoding an infectious RNA molecule of a North
American porcine reproductive and respiratory syndrome virus for use as
a vaccine in protecting swine and other animals from infection by a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      more heterologous antigenic epitopes, or a plasmid encoding such a PRRS virus. Also provided are isolated polynucleotide molecules, viral vectors, and transfected host cells that comprise a nucleotide sequence encoding a peptide of a North American PRRS virus. These
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          are useful in providing peptides to compensate for mutated peptide coding sequences of DNA sequences encoding genetically modified North American PRRS viruses so that functional virions can be

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by the treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which has products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. Primers AAX36234-X36254 were used in the sequencing of maize D8 gene (a homologue of the Rht gene) clones, in the course of the invention.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ONF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ONF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide

This sequence encodes a H. pylori inner membrane protein.
Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The nucleic acid sequences, and corresponding proteins, are also useful for generating vaccines for immunising subjects against H.
production, e.g. in E. coli hosts.
Note: This DNA sequence is not reproduced in the specification and has
been derived from the related specification, WO9719098.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transmembrane; cytoplasmic; cell envelope; flagella; transport; secreted; periplasmic; chronic gastritis; duodenal ulcer disease; activator; inhibitor; bacterial life cycle; vaccine; immunise; detection; antisense; inhibition; ds.

                                                                                                                                                                                                                                                                                                                                             -NDC-81
      pylori or for use in detecting the presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique batxII-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts shotgun subclone libraries. The purified DNA samples were then
                                                                                                                  Note: The ORF/protein reference number for this sequence was obtained from the related specification, WO9640893.
                                                                                                                                                                                                                                                                                                                                                                                                                      Hybridisation assay; genetic mapping; gene expression control; protein identification; signal transduction pathway; metabolic pathway; promoter; termination sequence; ss.

secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytoplasmic; vaccine; prevention; treatment; infection; envelope; identification; binding compound; bacterium; life cycle; activator; bacteria; inhibitor; duodenal ulcer disease; chronic gastritis;

infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55/59) was determined from coverlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

```
This sequence represents a polynucleotide of the invention. It was isolated from Helicobacter pylori and encodes a H.pylori GHPO protein. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroducdenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcr diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and its flanking regions was determined (AAQ66797). The spheroidin gene can be used as the location for insertion of heterologous DNA in insect and mammalian expression systems. A spheroidin-like gene was also identified in CDEPV and its amino acid sequence was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New entomopoxvirus polynucleotide sequences, proteins and vectors - are used for expression of heterologous proteins in both insect and mammalian host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence of the Amsacta moorel entomopoxvirus spheroidin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Spheroidin; gene expression; vector; insect cell culture;

The present squares to make the expression systems of the invention. The specification describes an EPV expression system that is capable of directing the replication and expression of a heterologous gene in a selected host cell. The expression system comprises an EPV promoter sequence operably linked to the selected heterologous gene in a selected host cell. The expression of a heterologous sequence operably linked to the selected heterologous gene sequence operably linked to the spected heterologous gene heterologous sequences and the production of selected proteins in insect and mammalian host cells e.g. human, rodent and primate cells. EPV thymidine kinase and spheroidin genes can also be used in vertebrate poxitruses such as vaccinia and swinepox virus. The expression vectors can also be used for the control of insect pests through the insertion of a gene encoding an insect toxin into the capression vector which will infect the target pest and produce large quantities of the toxin. Spheroidin and thymidine kinase are nonessential proteins which makes them ideal for the insertion of exogenous DNA and they are capable of operating in a vertebrate poxvirus (e.g. vaccinia)-mammalian cell-mediated and humoral immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an Entomopoxvirus (EPV) spheroidin-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      vel expression system for the expression of heterologous sequences insect and mammalian host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Spheroidin; Entomopoxvirus; expression system; replication; heterologous gene expression; thymidine kinase; poxvirus; vaccinia; swinepox virus; insect pest control; immunity; ss.

The present sequence represents an Entomopoxvirus (EPV) spheroidin-like gene sequence. It is used to make the expression systems of the invention. The specification describes an EPV expression system that is capable of directing the replication and expression of a heterologous gene in a selected host cell. The expression system comprises an EPV promoter sequence operably linked to the selected heterologous gene promoter sequence operably linked to the selected heterologous gene capaned. The expression system is used for the expression of heterologous sequences and the production of selected proteins in insect and mammalian host cells e.g. human, rodent and primate cells. EPV thymidine kinase and spheroidin genes can also be used in vertebrate poxviruses such as vaccinia and swinepox virus. The expression vectors can also be used for the control of insect pest the insertion of a gene encoding an insect toxin into the expression vector which will infect the target pest and produce large proteins which makes them ideal for the insertion of exogenous DNA and they are capable of operating in a vertebrate poxvirus (e.g. vaccinia) and thymidine kinase are able to mammalian cell expression vector system. Pox viruses are able to
                                                                                                                                                                                                                                                                       Choristoneura fumiferana entomopoxvirus spheroidin-like gene sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel expression system for the expression of heterologous sequences in insect and mammalian host cells

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis, such as paclobutrazol, dwarf but let crop plants grow tall. The present sequence was dwarf but let crop plants grow tall. The present sequence was cobtained after partially sequencing wheat Rht clone 5al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New Triticum Aestivum polynucleotides - encode a polypeptide which provides inhibition of the growth of plants, which inhibition is antagonised by gibberellin, used to confer a dwarf phenotype

AAM25966 to AAM99904 encode the human proteins given in AAM25225 to AAM25963. The proteins can have activities based on the tissues and calls they are expressed in, such as: antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system, virucide; antibacterial; endocrine; cardiant; cardiovascular; antianaemic; antiaggregant; hammostatic; vulnerary; antiuloer; osteopathic; dermatological; antialergic; antiasthmatic; antiparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production, The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neuroprotective, antidepressant; nootropic; antiparkinsonian; infection; immunostimulant; gene therapy; antisense therapy; vaccine, inflammation; antianaphylactic; rheumatoid arthritis; septic shock; pancreatitis; cardiac dysfunction; neuropathology; cardiac anaphylaxis; autoimmunity; genetic disease; haematopoletic disorder; platelet disorder; asthma; allergic rhinitis; diabetes; severe combined immunodeficiency; allergic rhinitis; diabetes; multiple sclerosis; depression; heurological disorder; so, neurodegenerative disorder; neurological disorder; ss.

```
The present invention describes a purified or isolated nucleic acid sequences (I) consisting essentially of one of the 93 nucleotide sequences given in AAH81202 to AAH81294, where expression of the nucleic acid in a microorganism is capable of inhibiting proliferation of a microorganism. (I) have antibacterial and antibiotic activities, and can be used in gene therapy. Expression of (I) in a microorganism inhibits proliferation of the microorganism, and the manufactured antibiotic is useful for reducing the activity or level of a gene product required for proliferation of a microorganism in a subject, specifically humans. The nucleic acids that inhibit bacterial growth or proliferation can be used
rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic diseaders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczema, allergic rhintitis, asthma, diabetes, cancer, multiple sclerosis, depression, Alzheimer's disease, Parkinson's disease, neurodegenerative and neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Escherichia coli protein encoding nucleotide sequence SEQ ID NO:262.

as antisense therapeutics for killing bacteria. In addition to rherapeutic applications, the nucleic acid sequences complementary to sequences required for proliferation can be used as diagnostic tools. For example, nucleic acid probes complementary to proliferation-required sequences that are specific for particular species of microorganisms can be used as probes to identify particular microorganism species in clinical specimens. AAH81035 to AAH81487 encode the Escherichia coli proteins given in AAG98239 to AAH81487 and AAH81488 to AAH81491 represent oligonucleotides, which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ξ

AA253015 to AA254536, AA254577 to AA254615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54571 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine;

represent novel Neisseria menigitis and N. genorrheae polynucleotides and polypeptides. AAZ5457 to AAZ5576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing in the neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy; ds.

AAQ71977 is the DNA sequence of murine IL-2R gamma AAR59094, this was used in the development of a claimed method for the diagnosis of X-linked severe combined immunodeficiency (XSCID), in female carriers and male sufferers.
                                                                                                                                Diagnosis of x-linked severe combined immunodeficiency (XSCID) comprises detecting mutated IL-2R gamma gene, also vectors and transgenic animals containing the mutated gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     seq_name: /SIDS2/gcgdata/geneseq/geneseqn/NA2001.DAT:AAS06754

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54577 to AAZ54576 and AAZ54575 and AAZ54573 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisseria bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

Polynucleotide sequence encoding human protein kinase #54.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sudarsanam S,
```

diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections -

Example 1; Figure 1; 433pp; English.

AASO6701-AASO6757 encode for novel human protein kinases #1-57. The
novel protein kinases have been identified as members of the tyrosine
or serine/threonine kinase (PTK and STK) families. The polynucleotides
encoding protein kinases and the polypeptides may be used in the
prevention, diagnosis and treatment of diseases associated with
the prevention, diagnosis and treatment of disease associated with
the properlate kinase expression. For example, they may be used to treat
cancers (especially cancers of haematopolatic origin), cardiovascular
disease (e.g. atherosclercsis), metabolic disorders (e.g. diabetes),
immune related diseases (e.g. rheumatoid arthritis), neurological
disorders (e.g. schizophrenia), neurodegenerative disorders (e.g. asthma), infectious
disorders (e.g. HIV) and reproductive disorders (e.g. infertility).
Additionally, polynucleotides encoding protein kinases may be
used for gene therapy and as DNA probes in diagnostic assays.
The protein kinase polypeptides may be used as antigens in the production
of antibodies against the protein kinases and in assays to identify
modulators of protein kinase expression and activity.

/tissue_type="Geed coats"
/lab_host="E. coli strain XLOLR"
/note="Vector: pBK-CMY, Site_1: EcoRI; Site_2: XhoI; This cona library was constructed from polyA+ enriched mRNA from green seed coats in mid to late developemental stage, average fresh weight 250 mg per seed. Traces of pod and embryo tissue also present. Complementary DNA was synthesized from mRNA using an XhoI-poly(dT)
linker-primer. EcoRI adopters were ligated to the blunt-ended coDNA fragments and the products were digested with XhoI for directional cloning into lambda ZAP Express vector. This lambda library was amplified once using E. coli host strain XLI Blue MRF'. Inserts were then subcloned by mass excision using ExAssist helper phage for conversion into phagemid vector pBK-CMY in E. coli host strain XLOLR."
                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; Rosidae; eurosida I; Fabales; Fabaceae; Papilionoideae; Phaseoleae;

/dev.stage="harvested after 5 site_1: EcoRI; Site_2:
XhoI; Plants were grown in an aeroponic chamber for 14
days on nitrogen-rich medium followed by 3 days on N-free
medium. RNA was extracted from root tips (1-3 cm). cDNA
was prepared from polyA+ enriched RNA. The cDNA was
directionally ligated into Uni-zapXR vector from
Stratagene and packaged using Giapack Gold packaging
extracts. Plasmids containing cDNA inserts were
mass-excised from phage stocks using ExAssit helper phage
and propagated in SOLR cells. Clone ordering and
sequencing was performed by the Centre National de
Sequencage (Genoscope, Evry, France)."

/note="Vector: pBluescript pSK; Site_]: EcoRi; Site_2:
XhoI; Plants were grown in an aeroponic chamber for 14
days on nitrogen-rich medium followed by 3 days on N-free
medium. RNA was extracted from root tips (1-3 cm). cDNA
was prepared from polyA+ enriched RNA. The cDNA was
directionally ligated into Uni-zapKR vector from
Stratagene and packaged using Gigapack Gold packaging
extracts. Plasmids containing cDNA inserts were
mass-excised from phage stocks using ExAssit helper phage
and propagated in SOLR cells. Clone ordering and
sequencing was performed by the Centre National de
Sequencage (Genoscope, ENTY, France)."
